

Desktop Security Risk Assessment

**OUR COMPREHENSIVE DESKTOP SECURITY
RISK ASSESSMENT WILL PREPARE YOU FOR
YOUR NEXT REGULATORY EXAM**

Assessments

According to the FFIEC IT Examination Handbook, "The frequency of testing should be determined by the institution's risk assessment. High-risk systems should be subject to an independent diagnostic test at least once a year."

A Desktop Security Risk Assessment of your organization's information systems will help your organization comply with FFIEC security testing guidelines and industry best practices.

- **Audits:** Auditing compares current practices against a set of standards.
- **Assessments:** An assessment is a study to locate security vulnerabilities and identify corrective actions.

Armarius' team of data loss prevention experts will work with your organization to understand your unique data security requirements and priorities while sharing insight into your industry's best practices. By auditing a sample of your network desktops and laptops, we will provide your company with our in-depth Desktop Security Risk Assessment Report which goes beyond your typical "network scan" and gives you a real snapshot of your computer environment.

The Desktop Security Risk Assessment will show:

- Current user behavior
- Potential data loss
- Application access and usage
- Information communication

Why Armarius Software?

The Armarius Software Difference

- Provide Identity Theft Protection for all customers throughout your organization
- Protect all customer information received and stored electronically
- Develop and maintain information security policies
- Develop and maintain an information security program
- Provide internal risk assessment and audit report
